## 1. Disclaimer

The audit makes no statements or warranties about utility of the code, safety of the code, suitability of the business model, investment advice, endorsement of the platform or its products, regulatory regime for the business model, or any other statements about fitness of the contracts to purpose, or their bug free status. The audit documentation is for discussion purposes only.

The information presented in this report is confidential and privileged. If you are reading this report, you agree to keep it confidential, not to copy, disclose or disseminate without the agreement of What is Beauty Inc. If you are not the intended receptor of this document, remember that any disclosure, copying or dissemination of it is forbidden.

Major Versions / Date	Description
0.1 (26.06.2022)	Layout
0.4 (01.07.2022)	Automated Security Testing Manual Security Testing
0.5 (04.07.2022)	Verify Claims and Test Deployment
0.6 (05.07.2022)	Testing SWC Checks
0.9 (07.07.2022)	Summary and Recommendation
1.0 (08.07.2022)	Final document
1.1 (18.07.2022)	Re-check 48b4efef6f2e396c3af21389eaa2e96f65a74741
1.2 (25.07.2022)	Added deployed contract

## 2. About the Project and Company

### Company address:

What is Beauty Inc.  
475 5th Ave, New York  
NY 10017, United States

**Website:** <https://whisbeverse.wtf>

**Twitter:** <https://twitter.com/whisbe>

**Instagram:** <https://instagram.com/whisbe>

**Discord:** <https://discord.gg/whisbeverse>

**NiftyGateway:** <https://niftygateway.com/marketplace/artist/5954>

**OpenSea:** <https://opensea.io/collection/whisbe>

## 2.1 Project Overview

Vandalz is a collection of 11,111 unique 3D animated NFTs that live in the WhlsBeVerse. The WhlsBeVerse uniquely blends both physical and digital worlds together to truly connect communities. The collection shares the narrative of innocence lost, representing a turning point in WhlsBe's life. In this evolution of the series, the artist empowers his collectors to unlock their Vandalz' personal story, tying it to life changing events that have helped shape who they are today.

### About WhlsBe

Contemporary artist WhlsBe has established a formidable reputation in both the renegade world of street art but also the mainstream art world encompassing the museum, gallery and arena of public installations. His moniker, shorthand for “What is Beauty”, is at once innocuous and sweet and introduces more substantive themes of cultural examination and subversion that underline much of his body of work.

WhlsBe wanted to share his message with a broad spectrum of people, not only those who have access to museums and galleries and began putting up self-sanctioned work in the street in 2011. WhlsBe has partnered with charities and corporations ranging from the Art Works Charity Foundation to Charity Water to Red Bull to COACH and has exhibited work at notable events including Art Basel, Context & Art Show, Scope Art Show, and Art Southampton.

### 3. Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
Critical	9 – 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
High	7 – 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
Medium	4 – 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
Low	2 – 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
Informational	0 – 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

## 4. Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

### 4.1 Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:
  - i. Review of the specifications, sources, and instructions provided to Chainsulting to make sure we understand the size, scope, and functionality of the smart contract.
  - ii. Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
  - iii. Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to Chainsulting describe.
2. Testing and automated analysis that includes the following:
  - i. Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
  - ii. Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

## 5. Metrics

The metrics section should give the reader an overview on the size, quality, flows and capabilities of the codebase, without the knowledge to understand the actual code.

### 5.1 Tested Contract Files

The following are the MD5 hashes of the reviewed files. A file with a different MD5 hash has been modified, intentionally or otherwise, after the security review. You are cautioned that a different MD5 hash could be (but is not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of the review

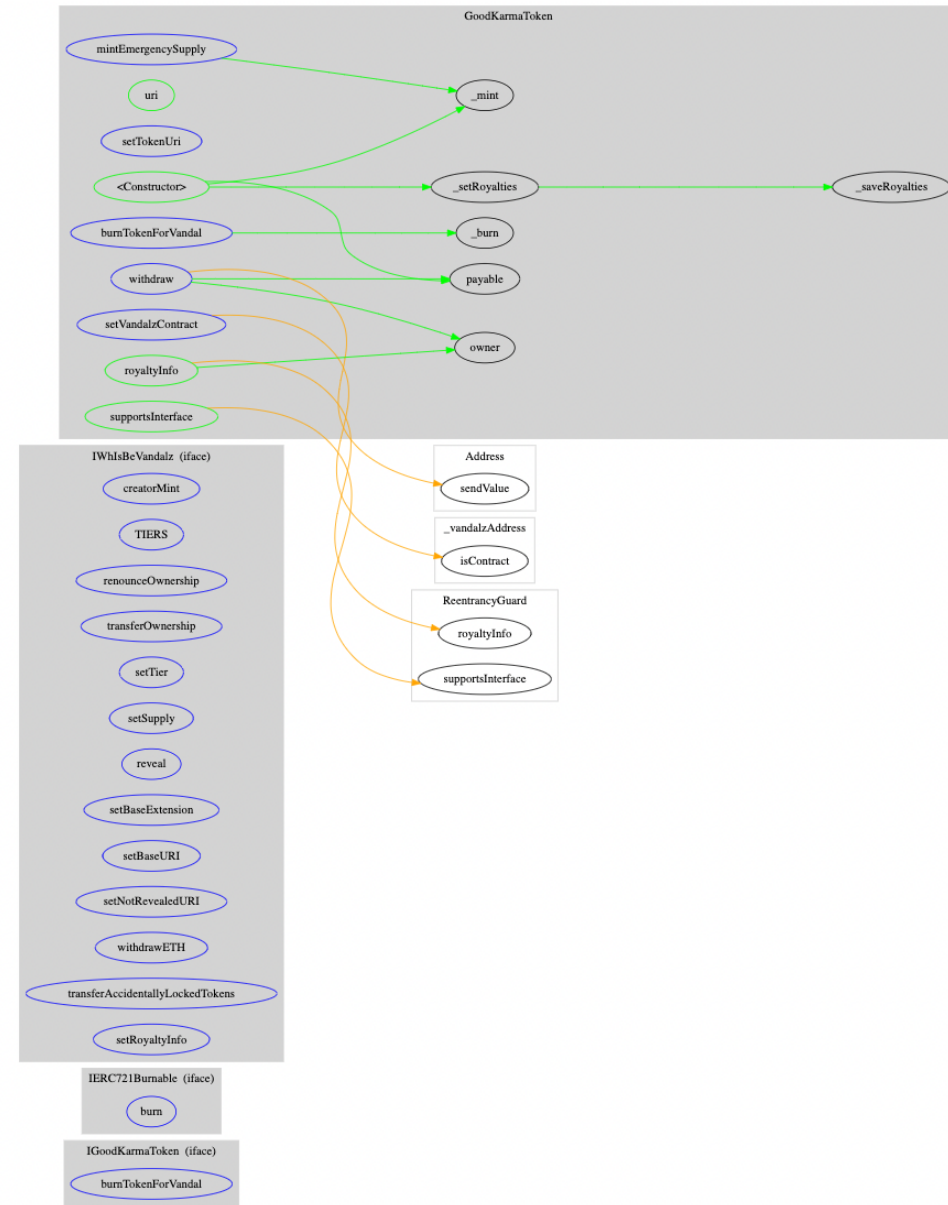

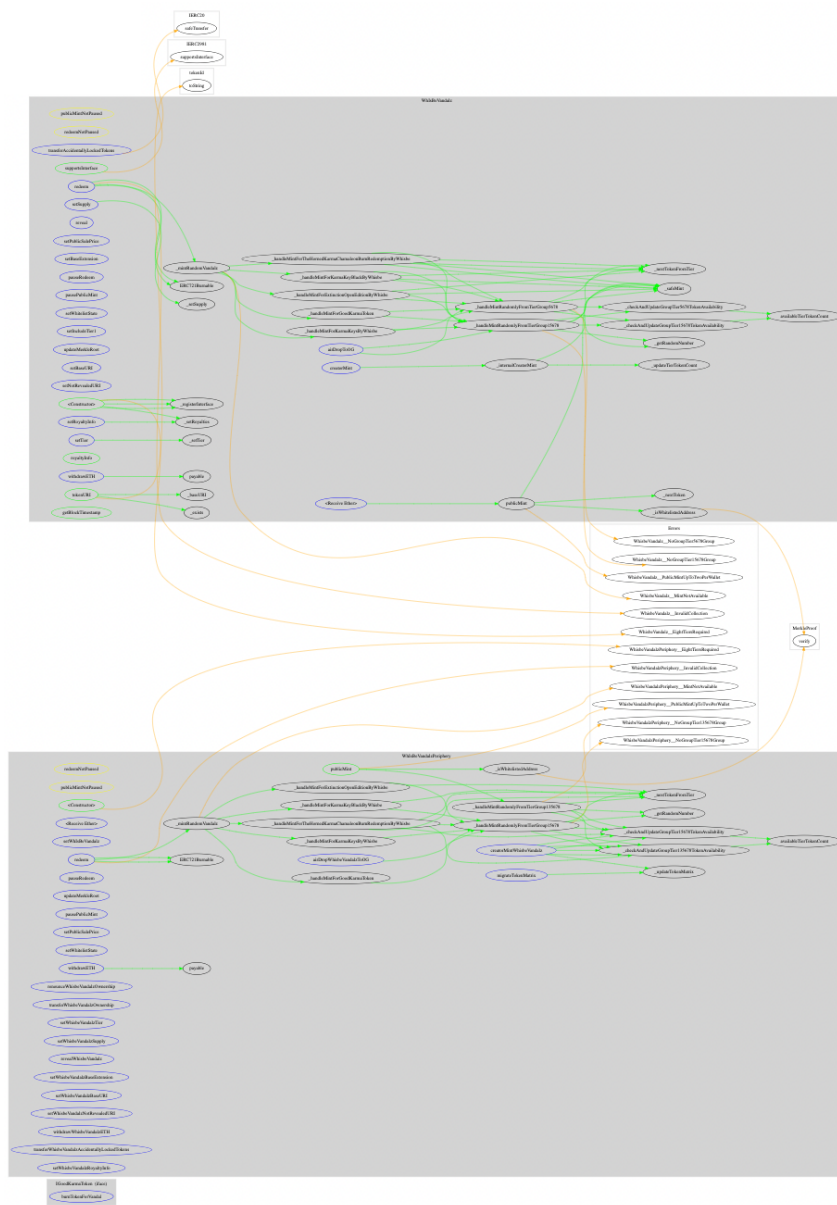

File	Fingerprint (MD5)

Legend: [ ]

- **Lines:** total lines of the source unit
- **nLines:** normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)
- **nSLOC:** normalized source lines of code (only source-code lines; no comments, no blank lines)
- **Comment Lines:** lines containing single or block comments
- **Complexity Score:** a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

## 6. Scope of Work

The Long Lost Friends Team provided us with the files that needs to be tested. The scope of the audit is the WhIsBe Vandalz contract.

The team put forward the following assumptions regarding the security, usage of the contracts:

- The ERC-721 / 1155 Token standard is correctly implemented
- Deployer/Owner cannot mint any new Token
- Deployer/Owner cannot burn or lock user funds
- Deployer/Owner cannot pause the contract
- The smart contract is coded according to the newest standards and in a secure way.

The main goal of this audit was to verify these claims. The auditors can provide additional feedback on the code upon the client's request.

## 6.1 Findings Overview

No	Title	Severity	Status
6.2.1	Predictable Random Number	MEDIUM	FIXED
6.2.2	Centralization Risk	MEDIUM	ACKNOWLEDGED
6.2.3	Unlimited Mint	MEDIUM	ACKNOWLEDGED
6.2.4	Missing Value Verification	LOW	ACKNOWLEDGED
6.2.5	Floating Pragma Version Identified	INFORMATIONAL	ACKNOWLEDGED
6.2.6	Missing Natspec Documentation	INFORMATIONAL	ACKNOWLEDGED
6.2.7	Missing Error Message	INFORMATIONAL	ACKNOWLEDGED
6.2.8	Storing Data Via baseURI	INFORMATIONAL	ACKNOWLEDGED

## 6.2 Manual and Automated Vulnerability Test

### CRITICAL ISSUES

During the audit, Chainsulting's experts found **0 Critical issues** in the code of the smart contract.

### HIGH ISSUES

During the audit, Chainsulting's experts found **0 High issues** in the code of the smart contract.

### MEDIUM ISSUES

During the audit, Chainsulting's experts found **3 Medium issues** in the code of the smart contract.

#### 6.2.1 Predictable Random Number

Severity: MEDIUM

Status: **FIXED**

Code: CWE-330

File(s) affected: ERC721RandomlyAssignVandalzTier.sol, ERC721RandomlyAssignVandalzTierPeriphery.sol

Commit: b48127fbdd9985d5c70ebadef771c02433b31f54, 08ba5d083907e57790bb51907b2c67f3e062d285

<b>Attack / Description</b>	By using the blockhash and the block variable attributes, malicious users can predict the outcome of the random number generation.
<b>Code</b>	<div>Line 137 - 153 (ERC721RandomlyAssignVandalzTier.sol)</div> <pre>function _getRandomNumber() internal view virtual returns (uint256) {     return         uint256(             keccak256(                 abi.encodePacked(</pre>

```

        msg.sender,
        block.coinbase,
        blockhash(block.number),
        block.gaslimit,
        block.timestamp,
        tokenCount(),
        availableTokenCount(),
        totalSupply()
    )
}
);
}

Line 148 - 165 (ERC721RandomlyAssignVandalzTierPeriphery.sol)

function _getRandomNumber() internal view virtual returns (uint256) {
    return
        uint256(
            keccak256(
                abi.encodePacked(
                    msg.sender,
                    block.coinbase,
                    blockhash(block.number),
                    block.gaslimit,
                    block.timestamp,
                    tokenCount(),
                    availableTokenCount(),
                    totalSupply()
                )
            )
        );
}

```

	}
<b>Result/Recommendation</b>	Consider using an oracle or Chainlink VRF to generate randomness. <a href="https://docs.chain.link/docs/chainlink-vrf/">https://docs.chain.link/docs/chainlink-vrf/</a>

### 6.2.2 Centralization Risk

Severity: MEDIUM

Status: ACKNOWLEDGED

Code: NA

File(s) affected: WhisbeVandalz.sol, GoodKarmaToken.sol

<b>Attack / Description</b>	The Owner has the rights to mint token, set baseURI and pause mint / redemption. This represents a significant centralization risk, where the Owner has too much control over the contract. The auditor has not recognized any multi-signature structure.
<b>Code</b>	<p>Line 310 – 331 (WhisbeVandalz.sol)</p> <pre> function creatorMint(address _to, uint256[] memory _tokenIds) external onlyOwner {     for (uint256 _i; _i &lt; _tokenIds.length; _i++) {         _internalCreatorMint(_to, _tokenIds[_i]);     } }  /**  * @notice  * @dev  */ function _internalCreatorMint(address _to, uint256 _tokenId) internal ensureAvailability {     _updateTierTokenCount(_tokenId);     _safeMint(_to, _tokenId); } </pre>

```
/**
 * @notice
 * @dev
 */
function setSupply(uint256 _supply) external onlyOwner {
    _setSupply(_supply);
}
```

Line 74 (WhisbeVandalz.sol)

```
bool public publicMintPaused = true;
```

Line 92 (WhisbeVandalz.sol)

```
bool public redeemPaused = true;
```

Line 420 - 422 (WhisbeVandalz.sol)

```
function setBaseURI(string memory _newBaseURI) external onlyOwner {
    baseURI = _newBaseURI;
}
```

Line 47 - 50 (GoodKarmaToken.sol)

```
function mintEmergencySupply(uint256 _numNewTokens) external onlyOwner {
    MAX_SUPPLY += _numNewTokens;
    _mint(msg.sender, GoodKarmaTokenID, _numNewTokens, "");
}
```

<b>Result/Recommendation</b>	If the Owner wallet/private key gets into the wrong hands, caused by a leak or hack, then it's easily possible to harm the project. We recommend protecting the Owner wallet with a multi-signature structure, such as gnosis safe or add on-chain governance for roles.
------------------------------	--

### 6.2.3 Unlimited Mint

Severity: MEDIUM

Status: ACKNOWLEDGED

Code: NA

File(s) affected: WhisbeVandalz.sol, GoodKarmaToken.sol

<b>Attack / Description</b>	The creatorMint and mintEmergencySupply function allows the Owner to mint new tokens to a specific address. If this function is not used carefully, it can cause inflation of the tokens.
<b>Code</b>	<p>Line 310 - 314 (WhisbeVandalz.sol)</p> <pre>function creatorMint(address _to, uint256[] memory _tokenIds) external onlyOwner {     for (uint256 _i; _i &lt; _tokenIds.length; _i++) {         _internalCreatorMint(_to, _tokenIds[_i]);     } }</pre> <p>Line 47 - 50 (GoodKarmaToken.sol)</p> <pre>function mintEmergencySupply(uint256 _numNewTokens) external onlyOwner {     MAX_SUPPLY += _numNewTokens;     _mint(msg.sender, GoodKarmaTokenID, _numNewTokens, ""); }</pre>

<b>Result/Recommendation</b>	Consider adding some restrictions to the mint or add multi-signature to the Owner functions.

## LOW ISSUES

During the audit, Chainsulting's experts found **1 Low issue** in the code of the smart contract.

### 6.2.4 Missing Value Verification

Severity: LOW

Status: ACKNOWLEDGED

Code: CWE-354

File(s) affected: ERC721RandomlyAssignVandalzTier.sol, ERC721RandomlyAssignVandalzTierPeriphery.sol

<b>Attack / Description</b>	Certain functions lack a value safety check, the values of the arguments should be verified to allow only the ones that comply with the contract's logic. In the constructor, the <code>_startFrom</code> variable should not have a big value, otherwise, incrementing the token count will cause an overflow, therefore, no new tokens can be minted.
<b>Code</b>	Line 34 - 36 (ERC721RandomlyAssignVandalzTier.sol, ERC721RandomlyAssignVandalzTierPeriphery.sol) <pre> constructor(uint256 _totalSupply, uint256 _startFrom) ERC721LimitedSupply(_totalSupply) {     startFrom = _startFrom; } </pre>
<b>Result/Recommendation</b>	Certain functions lack a value safety check, the values of the arguments should be verified to allow only the ones that comply with the contract's logic.

## INFORMATIONAL ISSUES

During the audit, Chainsulting's experts found **4 Informational issues** in the code of the smart contract.

### 6.2.5 Floating Pragma Version Identified

Severity: INFORMATIONAL

Status: ACKNOWLEDGED

Code: SWC-103

File(s) affected: ALL

<b>Attack / Description</b>	It is recommended to specify a fixed compiler version to ensure that the bytecode produced does not vary between builds. This is especially important if you rely on bytecode-level verification of the code.
<b>Code</b>	Line 1 <code>pragma solidity ^0.8.7;</code>
<b>Result/Recommendation</b>	It is recommended to follow the latter example, as future compiler versions may handle certain language constructions in a way the developer did not foresee. It is advised that floating pragma should not be used in production. Both truffle-config.js and hardhat.config.js support locking the pragma version.  i.e. Pragma solidity 0.8.7

### 6.2.6 Missing Natspec Documentation

Severity: INFORMATIONAL

Status: ACKNOWLEDGED

Code: NA

File(s) affected: ALL

<b>Attack / Description</b>	Solidity contracts can use a special form of comments to provide rich documentation for function, return variables, and more. This special form is named Ethereum Natural Language Specification Format (NatSpec).
<b>Code</b>	<pre>/**  * @notice  * @dev  */</pre>
<b>Result/Recommendation</b>	It is recommended to include natspec documentation and follow the doxygen style including @author, @title, @notice, @dev, @param, @return and make it easier to review and understand the smart contract. Some comments are already added but increasing the comments will help to support the understanding of each function.

#### 6.2.7 Missing Error Message

Severity: INFORMATIONAL

Status: ACKNOWLEDGED

Code: NA

File(s) affected: WhisbeVandalz.sol

<b>Attack / Description</b>	Require statements check if a condition is true and allow code to flow only if the condition is true. If the condition is false, require will throw an error, the rest of the code will not be executed and the transaction will revert.
<b>Code</b>	Line 268 (WhisbeVandalz.sol) <pre>require(_collectionsLen == _tokenIds.length, "");</pre>
<b>Result/Recommendation</b>	It is a best practice to add error messages to each require statement.

## 6.2.8 Storing Data Via baseURI

Severity: INFORMATIONAL

Status: ACKNOWLEDGED

Code: NA

File(s) affected: WhisbeVandalz.sol

<b>Attack / Description</b>	In the current implementation the baseURI is not hardcoded or on-chain generated, means the owner/creator is free to choose the way how the metadata file is stored.
<b>Code</b>	Line 420 - 422 (WhisbeVandalz.sol) <pre>function setBaseURI(string memory _newBaseURI) external onlyOwner {     baseURI = _newBaseURI; }</pre>
<b>Result/Recommendation</b>	<p>We recommend using IPFS and pinning services to make the metadata behind the baseURI permanently stored or implement into the event creation service.</p> <p>To ensure that data persists on IPFS, and is not deleted during garbage collection, data can be pinned to one or more IPFS nodes. Pinning gives you control over disk space and data retention. As such, you should use that control to pin any content you wish to keep on IPFS indefinitely.</p> <p>Check more information here: <a href="https://docs.ipfs.io/concepts/persistence/#persistence-versus-permanence">https://docs.ipfs.io/concepts/persistence/#persistence-versus-permanence</a></p> <p>Keep in mind even if you use an IPFS Service, the file will only exist as long if it is “pinned”. And you still may need a dedicated gateway to serve your files with a decent speed, which may lead to your metadata requests timing out in the future.</p> <p>Please investigate SVG generated on-chain visuals and on-chain stored metadata, for persistent storage.</p>

## 6.3 SWC Attacks

ID	Title	Relationships	Test Result
<a href="#">SWC-131</a>	Presence of unused variables	<a href="#">CWE-1164: Irrelevant Code</a>	✓
<a href="#">SWC-130</a>	Right-To-Left-Override control character (U+202E)	<a href="#">CWE-451: User Interface (UI) Misrepresentation of Critical Information</a>	✓
<a href="#">SWC-129</a>	Typographical Error	<a href="#">CWE-480: Use of Incorrect Operator</a>	✓
<a href="#">SWC-128</a>	DoS With Block Gas Limit	<a href="#">CWE-400: Uncontrolled Resource Consumption</a>	✓
<a href="#">SWC-127</a>	Arbitrary Jump with Function Type Variable	<a href="#">CWE-695: Use of Low-Level Functionality</a>	✓
<a href="#">SWC-125</a>	Incorrect Inheritance Order	<a href="#">CWE-696: Incorrect Behavior Order</a>	✓
<a href="#">SWC-124</a>	Write to Arbitrary Storage Location	<a href="#">CWE-123: Write-what-where Condition</a>	✓
<a href="#">SWC-123</a>	Requirement Violation	<a href="#">CWE-573: Improper Following of Specification by Caller</a>	✓

ID	Title	Relationships	Test Result
<a href="#">SWC-122</a>	Lack of Proper Signature Verification	<a href="#">CWE-345: Insufficient Verification of Data Authenticity</a>	✓
<a href="#">SWC-121</a>	Missing Protection against Signature Replay Attacks	<a href="#">CWE-347: Improper Verification of Cryptographic Signature</a>	✓
<a href="#">SWC-120</a>	Weak Sources of Randomness from Chain Attributes	<a href="#">CWE-330: Use of Insufficiently Random Values</a>	✓
<a href="#">SWC-119</a>	Shadowing State Variables	<a href="#">CWE-710: Improper Adherence to Coding Standards</a>	✓
<a href="#">SWC-118</a>	Incorrect Constructor Name	<a href="#">CWE-665: Improper Initialization</a>	✓
<a href="#">SWC-117</a>	Signature Malleability	<a href="#">CWE-347: Improper Verification of Cryptographic Signature</a>	✓
<a href="#">SWC-116</a>	Timestamp Dependence	<a href="#">CWE-829: Inclusion of Functionality from Untrusted Control Sphere</a>	✓
<a href="#">SWC-115</a>	Authorization through tx.origin	<a href="#">CWE-477: Use of Obsolete Function</a>	✓
<a href="#">SWC-114</a>	Transaction Order Dependence	<a href="#">CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')</a>	✓

ID	Title	Relationships	Test Result
<a href="#">SWC-113</a>	DoS with Failed Call	<a href="#">CWE-703: Improper Check or Handling of Exceptional Conditions</a>	✓
<a href="#">SWC-112</a>	Delegatecall to Untrusted Callee	<a href="#">CWE-829: Inclusion of Functionality from Untrusted Control Sphere</a>	✓
<a href="#">SWC-111</a>	Use of Deprecated Solidity Functions	<a href="#">CWE-477: Use of Obsolete Function</a>	✓
<a href="#">SWC-110</a>	Assert Violation	<a href="#">CWE-670: Always-Incorrect Control Flow Implementation</a>	✓
<a href="#">SWC-109</a>	Uninitialized Storage Pointer	<a href="#">CWE-824: Access of Uninitialized Pointer</a>	✓
<a href="#">SWC-108</a>	State Variable Default Visibility	<a href="#">CWE-710: Improper Adherence to Coding Standards</a>	✓
<a href="#">SWC-107</a>	Reentrancy	<a href="#">CWE-841: Improper Enforcement of Behavioral Workflow</a>	✓
<a href="#">SWC-106</a>	Unprotected SELFDESTRUCT Instruction	<a href="#">CWE-284: Improper Access Control</a>	✓
<a href="#">SWC-105</a>	Unprotected Ether Withdrawal	<a href="#">CWE-284: Improper Access Control</a>	✓
<a href="#">SWC-104</a>	Unchecked Call Return Value	<a href="#">CWE-252: Unchecked Return Value</a>	✓

ID	Title	Relationships	Test Result
<a href="#">SWC-103</a>	Floating Pragma	<a href="#">CWE-664: Improper Control of a Resource Through its Lifetime</a>	✗
<a href="#">SWC-102</a>	Outdated Compiler Version	<a href="#">CWE-937: Using Components with Known Vulnerabilities</a>	✓
<a href="#">SWC-101</a>	Integer Overflow and Underflow	<a href="#">CWE-682: Incorrect Calculation</a>	✓
<a href="#">SWC-100</a>	Function Default Visibility	<a href="#">CWE-710: Improper Adherence to Coding Standards</a>	✓

## 6.4. Verify Claims

6.4.1 The ERC-721 / 1155 Token standard is correctly implemented

**Status:** tested and verified 

6.4.2 Deployer/Owner cannot mint any new Token

**Status:** tested and verified **X**

**See: 6.2.3 Unlimited Mint**

6.4.3 Deployer/Owner cannot burn or lock user funds

**Status:** tested and verified 

6.4.4 Deployer/Owner cannot pause the contract

**Status:** tested and verified **X**

**See: 6.2.2 Centralization Risk**

6.4.5 The smart contract is coded according to the newest standards and in a secure way.

**Status:** tested and verified 

## 7. Executive Summary

Two (2) independent Chainsulting experts performed an unbiased and isolated audit of the smart contract codebase.

The main goal of the audit was to verify the claims regarding the security and functions of the smart contract. During the audit, no critical, 3 medium, 1 low and 4 informational issues have been found, after the manual and automated security testing.

We advise Long Lost Friends team to implement the recommendations contained in all 8 of our findings, to further enhance the code's security and readability.

Update (27.07.2022): Long Lost Friends have addressed all issues and will secure the owner rights via multi-signature wallet structure.

## 8. Deployed Smart Contract

VERIFIED

## 9. About the Auditor

Chainsulting is a professional software development firm, founded in 2017 and based in Germany. They show ways, opportunities, risks and offer comprehensive blockchain solutions. Some of their services include blockchain development, smart contract audits and consulting.

Chainsulting conducts code audits on market-leading blockchains such as Hyperledger, Tezos, Ethereum, Binance Smart Chain, and Solana to mitigate risk and instil trust and transparency into the vibrant crypto community. They have also reviewed and secure the smart contracts of 1Inch, POA Network, Unicrypt, Amun, Furucombo among numerous other top DeFi projects.

Chainsulting currently secures [\\$100 billion](#) in user funds locked in multiple DeFi protocols. The team behind the leading audit firm relies on their robust technical know-how in the blockchain sector to deliver top-notch smart contract audit solutions, tailored to the clients' evolving business needs.

Check our website for further information: <https://chainsulting.de>

### How We Work

**1** -----

#### PREPARATION

Supply our team with audit ready code and additional materials

**2** -----

#### COMMUNICATION

We setup a real-time communication tool of your choice or communicate via e-mails.

**3** -----

#### AUDIT

We conduct the audit, suggesting fixes to all vulnerabilities and help you to improve.

**4** -----

#### FIXES

Your development team applies fixes while consulting with our auditors on their safety.

**5** -----

#### REPORT

We check the applied fixes and deliver a full report on all steps done.
